

Gate 3 A2 — John's Figma Comments

Open this only after recording independent findings from the companion and unannotated layouts PDF.

Read-only Figma API snapshot captured 2026-09-10. It preserves 12 exact messages across 10 A2/S12 threads. Spelling and punctuation are unchanged. A Figma comment is review evidence, not approval by itself; each thread therefore includes the later canonical disposition separately.

1. S07 — invalid-code state and administrator naming

Thread 1921835353 • node [59:16](#) • 2026-09-10 20:28:38 UTC • unresolved in Figma

Do we need an "invalid code" screen state?

Instead of JOHN please say Community Administrator

Canonical disposition: Yes. A bad/invalid code must be a distinct S07 state. It must also remain distinct from a connection/service failure that prevents validation. Use generic `Community Administrator` in participant-facing language.

2. S08 — administrator naming

Thread 1921835982 • node [59:16](#) • 2026-09-10 20:29:10 UTC • unresolved in Figma

CHANGE

john --> Community Administrator

Canonical disposition: Approved. Participant-facing membership status uses `Community Administrator`; John remains the pre-provisioned Boulder Heights administrator in the MVE-1 operating model.

3. S10 — address in pending-request detail

Thread 1921837569 • node [59:20](#) • 2026-09-10 20:30:31 UTC • unresolved in Figma

It should include the members address they input on their profile. This is most helpful for a admin to understand if someone is "part of the community" more than just name and phone number.

Canonical disposition: Approved with privacy limits. S10 may show the full resident-provided address only to the authorized administrator while the request is pending. It is not verified, ordinary-member-visible, or retained as an administrator-facing post-disposition history field.

4. S11/S12 — post-approval gate and resident denial

Thread 1921840404 • node [59:20](#) • 2026-09-10 20:33:00 UTC • unresolved in Figma

Question: for MVE1, will the only see this screen once they've been approved? Is this whole sequence GATED at S08 until admin approves?

What will the consumer see if Admin denies?

Reply 1921844778 • 2026-09-10 20:36:51 UTC

I assume that this is AFTER being admittied/approved. My comment on changing the header reflects this assumption.

Canonical disposition: Yes. Guidance and the normal shell occur only after approval; there is no community-less Events mode. Denial names the community, permits resubmission through S07, and offers a pre-addressed `Contact Community Administrator` email action without displaying the address.

5. S10/S08 — administrator and requester denial outcomes

Thread 1921840997 • node [59:20](#) • 2026-09-10 20:33:31 UTC • unresolved in Figma

similar to my note on S11, What will ADMIN see if they "deny"?

What will the requester see if denied?

Canonical disposition: The administrator returns to the current pending queue after disposition; detailed confirmation/failure/already-reviewed/changed states remain required. The requester receives the denial state and may receive a denial push subject to OS permission.

6. S09 — multiple pending requests

Thread 1921842280 • node [59:16](#) • 2026-09-10 20:34:39 UTC • unresolved in Figma

How will this screen look with multiple join requests? Will it be a scroll? How will it be sorted -- suggest by chronologic order received (so oldest requests at top --> newest)

Canonical disposition: Approved. The queue scrolls vertically and orders pending requests oldest first. A preview/count treatment is an approved starting point.

7. S11 — tutorial timing

Thread 1921843916 • node [59:20](#) • 2026-09-10 20:36:07 UTC • unresolved in Figma

We are NOT designing the tutorial now? I believe that was a previous canonical decision to come back to this at the very end. This is just to capture where it will be?

Canonical disposition: Correct. S11 currently captures placement, purpose, skip, and Help replay. Detailed progression is deferred until the core screens are established but remains required before Gate 3 low-fidelity closes.

8. S11 — placeholder heading

Thread 1921844315 • node [59:20](#) • 2026-09-10 20:36:28 UTC • unresolved in Figma

REMINDER to update this header to "Welcome to Your Community"

Canonical disposition: Approved as current placeholder copy, not final copy.

9. S12 — critical Home-page structure

Thread 1921847820 • node [59:20](#) • 2026-09-10 20:39:34 UTC • unresolved in Figma

Ok, i think we need to really align on the base wireframe... this seems like the first time we are really seeing the HOME PAGE of the App, yes? Were just showing it in two states: 1) accepted address 2) no address

Canonical disposition: Yes. This was the critical A2 structural issue. John supplied a paper sketch, approved the resulting Home-shell decisions, and later approved the separate Figma S12 exploration at node 73:2 as the structural baseline. The original S12a/S12b frames remain an uncorrected snapshot.

10. S12 exploration — annotation versus consumer copy

Thread 1921957664 • node [73:2](#) • 2026-09-10 22:56:07 UTC • resolved 2026-09-10 23:02:08 UTC

assume this is NOTES not actual consumer copy

Reply 1921961039 • 2026-09-10 23:02:07 UTC

resolved in R1 review

Canonical disposition: Confirmed. Everything outside the 390 × 844 phone frame is design/review annotation. The location-needed text is provisional, and all in-phone wording is also low-fidelity placeholder copy. John then approved the exploration's structure.

End state: These comments and canonical dispositions do not approve the full A2 batch or authorize correction by Claude. Claude should identify any genuinely new Tier 1/Tier 2 findings, distinguish them from already-approved corrections, and return the combined review to John.
