

Gate 3 Slice B — Founder Review Record

Open only after recording independent findings from the companion and unannotated layouts PDF.

This record preserves the exact text of John Elliott's native Figma comments #47–#56, followed by the explicit founder dispositions that produced the current layouts. Comments and early directions remain provenance even where a later decision superseded them.

Native Figma comments

#47 — Sheet 01 / node 112:24

Lets remove this one from the illustration. Its likely to never happen and is distracting...

Instead of this, lets add a "SPECIAL WEATHER STATEMENT" event/alert sample at the bottom.

Disposition: Implemented. The S13 feed sample now uses Special Weather Statement; this sample change does not remove Shelter-in-Place from the approved Protective Action family.

#48 — Sheet 01 / node 112:24

I like THIS last part. Smart to say not being able to populate does not mean there are no alerts.

Disposition: Preserved. S13b explicitly says the unusable-location state is not a "no current Events" result.

#49 — Sheet 01 / node 112:24

SO, my question here is how will this feed handle multiple alerts/updates per EVENT TYPE?

- 1) Just show the latest and "clicking" the alert links to our of the app to its "source"
- 2) Show the full feed Sorted by our EVENT TYPE PRIORITY (TBD) and the chronological updates by EVENT TYPE.

Disposition: The feed shows one current row per authoritative source lifecycle identity, with Event Type displayed. Opening the row leads to S14, where current state and chronological history for that same identity appear; the external source remains a separate action. Family governs policy/order. LHL does not infer identity from the Event Type label.

#50 — Sheet 02 / node 112:151

OH, i understand. Clicking the event tile in s13a opens THIS screen. So to my comment on the boundary in the above area... how will this handle multiple alerts for the same EVENT (type)?

Will it show the latest but also group all previous (when able)?

Disposition: Yes for updates belonging to the same source lifecycle identity: S14 puts the current source state before its chronological history. It does not group separate identities merely because they share a Type.

#51 — Sheet 02 / node 112:151

WHERE does this take a user?

Disposition: A Related Events row navigates to the distinct related Event's detail only when authoritative evidence or an approved deterministic rule establishes the relationship. Otherwise the entire section is absent.

#52 — Sheet 02 / node 112:151

What is this type? I think it should just be "I saw this update"? What is this intended to do, I don't understand.

Disposition: Implemented. Both S14 examples use `I saw this update` for acknowledgement of the exact eligible update shown. It is separate from Related Events, general status, and verified safety.

#53 — Sheet 02 / node 112:151

I don't understand what this is per my other comment.

Disposition: The S14 variants now express one conditional pattern: an established relationship shows Related Events; absence of evidence omits the section. Shelter-in-Place is not falsely linked to Wildfire.

#54 — Sheet 03 / node 112:278

Is this intended to be the followup screen from clicking "view responses"?

Disposition: Yes. S15 remains a provisional separate View responses destination for the selected community and exact update. Its location/scale remains open to testing.

#55 — original Sheet 03 / node 112:278

HOLD UP, we have never talked about this yet. Will we later? But there is no option currently in the check in feature from S12 that is "left area"??? Its only Home/Away

Final disposition: The current S12a and S12b Home Status controls now show `Home`, `Away`, and `Left affected area` together. Each is an inline adult-profile action. Exact final wording, additional states, confirmation/failure, and staleness remain open.

#56 — original Sheet 03 / node 112:278

How did someone arrive at this screen? From where?

Final disposition: No one does. John removed Event-specific check-ins from MVE1 and later directed S16's complete deletion. S12 records the general status inline without navigation; Event-Type-specific check-ins are Post-G6 discovery.

Subsequent explicit founder decisions

After the native comments, John confirmed that Related Events should appear only when a relationship can be established and otherwise should not be visible. He also required consistent `I saw this update` treatment across eligible S14 states.

John then superseded the earlier Event-specific check-in direction: "Let's leave in the future backlog the idea for event type specific checkins. But leave it out of MVE1".

His final interaction direction was to add "left affected area" to S12 Home Status and delete S16. Selecting an individual S12 status records the adult profile's timestamped update directly without an intermediate screen.

Interpretation boundary

These comments and dispositions authorized the corrected review baseline and preparation of this packet. They do not approve Slice B low-fidelity, S15 placement, final copy/layout, production implementation, source/provider selection, the roadmap task, or Gate 3 closure.
